Appendix A:

JADE

Java Agent Development Framework (JADE) is a software framework which developed by using JAVA language. It simplifies the development of multi agent system. JADE complies with FIPA standard and it helps to debug our agents when developing the project. Systems that are developed with JADE can be distributed regardless of the underlying operating system. JADE provides a remote GUI to configure and control the systems developed with the help of JADE. JADE configurations can be changed while running the system. This may include transferring an agent from one machine to another machine without stopping the live system. Since JADE is developed purely in JAVA language, it only requires JAVA version 5 or above.

Simple but powerful task execution background and composition model are provided by JADE. Also it supports peer-to-peer message passing based on asynchronous message passing paradigm. Furthermore JADE also supports yellow pages service and with the help of yellow pages service agents can publish their services and discover other agents.

JADE-LEAP is the mobile version of JADE. It is able to support various mobile phones such as J2ME devices and Android devices.

JADE is developed in Telecom Italia. Therefore Telecom Italia is the copyright holder of JADE. But it's licensed under LGPL license.
