Dissertation submitted in partial fulfillment of the requirements for the degree Master
of Science in Electrical Installation

Department of Electrical Engineering

University of Moratuwa

Sri Lanka

July 2018

DECLARATION

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief, it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

The power requirement to operate a radio base station site is getting increased day by day due to the introduction of new services. Apart from that in order to provide a high-quality service to their customers operators tends to invest more on redundant power sources as well. At the same time, it's very important to reduce the capital costs and operational costs as much as possible to maintain the financial stability of the mobile operating companies. So, it's important to address the power requirements in an optimum manner. This thesis comprehensively explains an effort taken to identify the optimum way of providing grid power and the backup power for the telecom base stations. A simulation model is developed to derive the optimum hybrid power supply model with the best combination of mixed battery bank and diesel generator that determines, the optimal capital & operational cost for an RBS site with given load, type and environmental factors. This simulation model will mainly address existing energy sources optimization, backup power for poor grid connected sites and capacity upgrades in backup power supply. Also for the first time in Sri Lanka battery bank mixing was introduced for the radio base station sites with the help of this study.

ACKNOWLEDGEMENT

First and foremost, I would like to express my sincere gratitude to my advisor Dr. W. D. Asanka S. Rodrigo, Senior Lecturer from Electrical Engineering Department at University of Moratuwa for the continuous support of my M.Sc. study and research, for his patience, motivation, enthusiasm, and immense knowledge. Besides my advisor, I would like to thank the rest of the lectures from Electrical Engineering Department at University of Moratuwa for their encouragement, insightful comments, and hard questions in progress reviews.

This research was supported by Dialog Axiata PLC and E.co Services Lanka. I thank Energy Management Division who provided insight and expertise that greatly assisted in this research and a special gratitude to Gayathri Amarakoon & Kasun Wijesinghe from E.co Services Lanka group for providing me the resource and valuable knowledge in technical calculations and with industrial references.

Last but not the least; I would like to convey my sincere gratitude to my spouse, parents, family members & friends for helping me in numerous ways to achieve my goals all the time.

LIST OF ABBREVIATIONS

Abbreviation	Description
RBS	Radio Base Station
DAP	Dialog Axiata PLC
PV	Photovoltaic
OPEX	Operational Expenditure
CAPEX	Capital Expenditure
VRLA	Valve Regulated Lead Acid
DG	Diesel Generator
POC	Proof of Concept
TCO	Total Cost of Ownership
KPI	Key Performance Indicator
BB	Battery Bank
Li Ion	Lithium Ion
AC	Alternative Current
DC	Direct Current
AGM	Absorbent Glass Mat
FCB	Free Cooling Box
DoD	Depth of Discharge
CPH	Consumption Per Hour
CEB	Ceylon Electricity Board
O & M	Operation & Maintenance
NPV	Net Present Value
