

A Review of Trespassing Accident and Suicide on Railway Track for Pedestrian Safety

Eng. Abey Siri Munasinghe Asoka

148301 B

Dissertation submitted in partial fulfilment of the requirements for the
degree Master of Highway and Traffic Engineering

Department of Civil Engineering

University of Moratuwa

Sri Lanka

June 2018

DECLARATION OF THE CANDIDATE AND THE SUPERVISOR

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature: Date:

The above candidate has carried out research for the Masters dissertation under my supervision.

Signature of the supervisor: Date:

ABSTRACT

Railway accident prevention and protection are a key part of a wider picture of transport safety. The rail sector thus needs to improve its knowledge of trespassing and suicide related accidents in order to work out suitable responses by analysing measures already taken.

More than 100 people die each year in Sri Lanka due to the collision with a train due to suicides or trespassing. This research analyses the data related to above accidents recorded in Sri Lanka Railways. The following factors were considered for the analysis.

1. Distance from Colombo
2. Day and Month of the incident
3. The gender and age of the victim
4. Geometry of the railway track
5. Noise level of the surrounding area of the incident
6. Visibility between trespassers and train drivers
7. Weather condition
8. Permissible speed in the incident area
9. Availability of short paths avoiding railway track

The review of articles and data gives a picture of where, how and who is involved in suicide and trespass accidents.

Here the accidents implying persons out of level crossings, or “accidents to persons”, mostly involve unauthorized persons crossing or walking along the tracks, usually because of convenience. Another, much more common cause of fatalities and significant accidents out of level crossings is the suicidal intent of persons entering the railway premises to voluntarily be hit by a train.

The main similarities between railway suicides and trespassing accidents relate to gender and location: the victims in railway suicides and trespassing accidents and observed trespassers were predominantly male, and most of the railway suicides and trespassing accidents occurred in densely populated areas.

Keywords: Railway; safety; suicide; trespassing

ACKNOWLEDGEMENTS

It is with great pleasure and satisfaction I present this research report for the partial fulfilment of requirements of the Degree of Master of Engineering in Highway and Traffic Engineering in Faculty of Engineering, University of Moratuwa.

First I wish to thank the Transport Engineering Division of Department of Civil Engineering, Faculty of Engineering, University of Moratuwa for selecting me to follow this Master's course in Highway and Traffic Engineering.

I thank Sri Lanka Railways, my employer, for the sponsorship I received to follow this course as well as for releasing me to study for this degree on part time basis.

Next I wish to thank Prof. J.M.S.J. Bandara for his correct guidance and continuous support throughout this research. The knowledge I gathered from him apart this research work but in the lecture room was also valuable and greatly helped me.

I wish to thank all the staff of Transport Engineering Division of Department of Civil Engineering, Faculty of Engineering, University of Moratuwa, including visiting lecturers for their continuous efforts in enhancing our knowledge in this particular subject of highway engineering. My special thanks go to Prof. W.K. Mampearachchi, Dr. H.R. Pasindu, Dr. Dimantha De Silva and Mr. Loshaka Perera.

I do thank Eng. B.A.P. Ariyaratna, General Manager of Railways, Eng. J. Uthayakumar, Additional General Manager (Infrastructure), Eng. S.G. Premkumar, Chief Engineer (Way and Works), who greatly helped me in understanding the concepts of highway engineering in my work place.

Next I wish to thank my colleagues in the lecture room and the work place for their valuable assistance in following this course.

I extend my thanks to my dear father late Mr. A.M.K. Sumanadasa and my dear mother Mrs. A.L.A. Punyalatha who are the divine strength and courage behind all the successes in my life.

Finally I wish to thank to my wife Mrs. Indrani Manike and my three children for their patience and love for me throughout the period of this course

1 INTRODUCTION

1.1 *General Background*

The rail transport mode is made more effective and efficient by the fact that it connects the most populated areas at increasingly high speeds, providing social cohesion at local level. (El Miloudi El Koursi, 2016)

Train pedestrian collisions have been shown to be the leading cause of fatality in train related accidents in Sri Lanka. 365 number of trains are operating in 1600km length of track per day which is 30 000 train-km per day approximately.

That carries 21 million passenger-km per day in different speeds.

Most of the suburban train service and long distance service are delayed every day. 20% of them are caused due to trespass accidents or suicide as per the records of railway.

The rail sector thus needs to ensure its security against accidents and suicides occurring on its property in order to offer continued service and maximum reliability. Therefore analyse of this records of the accidents is important for railway efficiency and punctual running.

1.2 *Objectives*

Objective of this study is to analyse the data related to trespassers and suicide accidents, identify the patterns and propose suitable system to mitigate which could result in minimizing train related accidents and passenger delays due to fatal accidents.

1.3 Problem Statement

Over 300 trespass accidents are occurred every year which cause more than 100 deaths per year. Railway has to give duty leave to the train crew to support police investigation of the incident which will result in extra cost around 10,000 Rupees per incident for the railway.

The higher factor of cost of an incident affect the country's economy.

When one incident occur the average delay is 20mins per train which means wastage of 124,000 productive labour hours for the country (as average passenger travel is 374,000 per day then $374,000 * 20 / 60 = 124,666$ labour hours) resulting a cost of Rs.14.8 million. (As $124,000 * \text{Rs. } 120.00 = 14,850,000$ (as labour hour cost =Rs. 120.00) rupees per incident to the country's economy.

Average 100 people die each year due to trespass and suicide accidents in rail track, adding following cost for the country each year.

Investigation cost per department = $100 \text{nos} * \text{Rs. } 12000.00 \text{ per case} = \text{Rs. } 1,200,000.00$

GDP per capita in 2016 = US\$ 3768.70 =Rs. $160.00 * 3768.70 = \text{Rs. } 602,992.00$

Assume death person balance expected life time is 30 yrs

Total loss for families of the victim = $100 \text{ nos.} * \text{Rs. } 602,992.00 * 30 \text{ years} = \text{Rs. } 1808 \text{ million}$

Total loss per the year approximately = $14.8\text{M} + 1.2\text{M} + 1808\text{M} = \text{Rs. } 1,824 \text{ millions}$

1.4 Scope of the Report

Chapter 1 : Introduction. This chapter describes the general background of this study is based.

Chapter 2 : Literature Review. This chapter describes the literature referred.

Chapter 3 : Data Collection. In this chapter, the method used to collect data described.

Chapter 4: Analysis. In this chapter, collected data are analysed.

Chapter 5 : Conclusion and Recommendation. In this chapter, findings are tabulated and conclusions and recommendations are made.

2 LITERATURE REVIEW

There was not any literature on this matter in Sri Lanka. When considering the world no major research have been done except for few individual researches which were carried out by just reviewing articles.

1. El Miloudi El Koursi, J. L. (2016, March 17). Railway Accident Prevention and Infrastructure Protection. *Journal of Civil Engineering and Architecture*, 96-107.
2. Frittelli, J. (2018). *Trespassing: The Leading Cause of Rail-Related Fatalities*. Federation of Congress. Congressional Research Service.
3. Marie-Hélène Bonneau, G. H. (2014). How to prevent suicide and trespass on the railways and mitigate the consequences? Practical guide. International Union of Railways.
4. Silla, A. (25/01/2013). *Improving safety on Finnish Railways by prevention of trespassing*

2.1 Different intensions of trespassers

Mainly 3 different intensions of trespassing can be identified by referring to literature. They are,

1. Trespassing behaviours with no intent of casualty, like shortcutting, loitering in railway premises and vandalism.
2. Enter the tracks refers to suicide-specific aspects.
3. Unintentional trespassing, i.e., situations in which the circumstances result in inadvertently entering the tracks.

(El Miloudi El Koursi, 2016)

2.2 Rules and Regulations to prevent trespassing

Proper guidance have been given to employees of railways to prevent trespassing.

“Where recognized footpaths along or through railway land are in existence, steps must be taken to prevent right of way being established by the public. It will be the duty of the District Officer of the Way and Works Department to close such footpaths on the first Monday of December every year during the whole day, displaying notices pointing out that the public have no rights over the path and that if they trespass on railway property they do so at their own risk. The closing of the footpath must be notified prior to the closing in all the local newspapers and in the Government Gazette, and the District Officer must see that this is duly attended to.” (Special Rules, Way And Works Department, 1927)

“Inspectors, Foremen Platelayers, Overseers, Kanganies and other Way and Works employees should do all in their power to stop trespassing on the line by ordering persons having no pass or other authority for walking on the railway off railway premises. If any person or persons persist in using the railway as a public thoroughfare after being duly warned off, such cases should be reported to the District Engineer, so that steps may be taken for prosecutions.” (Special Rules, Way And Works Department, 1927)

DATA COLLECTION

Every train has a journal with the Head Guard of the train who is in-charge of the train. He noted down every incident of the train movement in the journal. Finally the data in the journal is entered into the main record book which is kept by the chief control office. The main resource of data for this study was the above mentioned main record book.

The location, date, description, train number, details about number of injured, deaths of the accidents are recorded in that book.

Data for years from 2011 to 2016 were extracted from that book.

Extract from the main record book has shown below.

Figure 1 : Extract from the main record book of Railway

The following data was collected from the field officers of the relevant area.

1. Noise level ; a qualitative measurement taken by field officers
2. Visibility ; Engine drivers viewing distance without obstruction
3. Geometry ; the track alignment
4. Availability of parallel lines ; available of parallel roads to use instead of rail track for pedestrians on both side or single side

The permissible speed of the incident area was taken from the part I of working time table issued by the Railway Operating Department. (An extract has attached below)

When reducing loads of trains on the request of Drivers they must give reasons on their train tickets for the inability to take the given loads. The Station Master concerned should forward a report to the Transportation Superintendent of the District or D/OPS in every such instance.

When the load of a train is reduced at the request of the Driver, the Guard must in addition to stating the reason in the journal for this step, should comprise and record in his journal the gross weight of the train prior to reduction.

MAXIMUM PERMISSIBLE SPEEDS

The following are the authorized maximum speeds of trains for the different sections, excepting certain restrictions subsequently detailed. It must be understood that trains are NOT booked to run at the maximum speeds shown below. The table is intended to serve as a guide to drivers as to the maximum speed at which they may run on the various sections when running late, load, weather, gradients, and local restrictions, permitting them to do so.

| Main Line | | Talaimannar Line | |
|--------------------------------------|-------|---|-------|
| Between | Kmph. | Between | Kmph. |

SPEED RESTRICTIONS — ROLLING STOCK

The following Speed Restrictions with regard to Rolling Stock must be strictly observed :—

| | K.M.P.H. | M.P.H. |
|--|----------|--------|
| Mixed and Goods Trains .. | .. 64 | .. 40 |
| Trains formed of one or more Four Wheeled Wagons .. | .. 48 | .. 30 |
| Passenger Trains— | | |
| (A) Old Passenger Stock .. | .. 72 | .. 45 |
| (B) New Passenger Stock 58 ft. 7 in. and 58 ft. 3 in. long over buffers .. | .. 80 | .. 50 |

NOTE :—

When trains are formed with New and Old type coaches, the speed restriction under (A) will apply.

The speeds indicated above must always be observed and should, under no circumstances be exceeded although the Maximum Permissible Speeds for the line on certain sections shown above are higher.

18

Figure 2 : Extract from the part I of working time table issued by the Railway Operating Department

The following changes were done after the rehabilitation of rail track from Kalutara South to Matara, from Omanthei to Kankasanturai and Madawachchiya to Thalaimannar

1. Kalutara South - Matara 100 km/h
2. Omanthei - Kankasanturai 100 km/h
3. Madawachchiya to Thalaimannar 100 km/h

3 ANALYSIS

3.1 Methodology

In this study, the most recent period where up to date information was taken into account, covering more specifically the year 2016 time-frame. More recent data are not fully available yet, and as it is the nearest time frame for which data is available, it would be an added advantage when interviewing the field officers.

First of all, the distance from Colombo in 50 km interval to the relevant location of the cases was analysed in order to identify the area with the highest frequency of accidents referring to the table and the figures below. Area within 50km of radius from Colombo was identified as the area with the highest frequency of trespass and suicide accidents on rail track which was 65% of the total number of cases reported during the year 2016. Therefore that area was considered for further analysis.

Table 1: Distance from Colombo

| Distance (km) | Number of accidents | Percentage (%) |
|--|---------------------|----------------|
| 0-50 (Only Double Track available) | 227 | 64.9 |
| 51-100 (Only Single Track available) | 59 | 17 |
| 101-150 (Only Single Track available) | 51 | 14.7 |
| 151-200 (Only Single Track available) | 11 | 3.2 |
| 201-250 (Only Single Track available) | 1 | 0.3 |
| Total | 349 | 100 |

- Location of 10 cases was not clear in the records.

Figure 3: Distance from Colombo

3.2 Analysis

3.2.1 Total Number of Cases in each year

Following table shows the number of cases occurred during the years 2011-2016. Further the number of injured, death and others are shown there.

Table 2: Total Number of Cases in each year

| Year | Cases | Injured | Death | Other | Train km operated in the year | Cases per million train km |
|------|-------|---------|-------|-------|-------------------------------|----------------------------|
| 2011 | 215 | 134 | 72 | 10 | 9,222,358 | 24 |
| 2012 | 342 | 201 | 119 | 40 | 9,882,738 | 34 |
| 2013 | 344 | 224 | 119 | 50 | 10,492,469 | 34 |
| 2014 | 386 | 252 | 108 | 95 | 10,616,707 | 35 |
| 2015 | 400 | 396 | 113 | 102 | 11,310,216 | 36 |
| 2016 | 359 | 342 | 98 | 92 | 11,476,126 | 32 |

Cases: Number of cases happened during the year.

Death: Number of deaths occurred.

Other: Number of lifetime disabilities occurred.

Injured: Total number of deaths and other plus minor injuries.

Figure 4: Cases per million train km

Figure 5 : Analysis of cases 2011-2016

A trend to increase in number of cases can be seen until year 2015. However there is a decrease in the number of cases in year 2016. The reason was not properly indicated in the data. Can be assumed that the awareness raised by the media in 2016 and other awareness programs were affected. (Photo 7, Photo 8)

3.2.2 Month

Following table shows the number of cases occurred during the year 2016 in a monthly basis.

Table 3 : Cases in Monthly Basis

| | Month | |
|----------------|-----------|-------------|
| | Frequency | Percent |
| January | 18 | 7.9 |
| February | 17 | 7.5 |
| March | 21 | 9.3 |
| April | 22 | 9.7 |
| May | 19 | 8.4 |
| June | 20 | 8.8 |
| July | 14 | 6.2 |
| August | 19 | 8.4 |
| September | 17 | 7.5 |
| October | 27 | 11.9 |
| November | 16 | 7 |
| December | 17 | 7.5 |
| Total | 227 | 100 |

Figure 6 : Cases in monthly basis

According to metrology departments records the highest rainfall intensity was recorded during Months, March, April and October. (Annual and monthly rainfall at observation stations)

3.2.3 Day

The following table shows the accidents occurred during year 2016 analysed according to the day of the week.

Table 4 : Cases according to day

| | Day | |
|-----------------|-----------|-------------|
| | Frequency | Percent |
| Monday | 40 | 17.6 |
| Tuesday | 43 | 18.9 |
| Wednesday | 29 | 12.8 |
| Thursday | 26 | 11.5 |
| Friday | 30 | 13.2 |
| Saturday | 22 | 9.7 |
| Sunday | 36 | 15.9 |
| Total | 226 | 99.6 |
| System | 1 | 0.4 |
| | 227 | 100 |

Figure 7 : Cases according to day

Sunday, Monday and Tuesday can be classified as relatively busy days of the week with respect to trespassing accidents. Further the number of Passenger move to Colombo suburban is higher in those 3 days. The increase in accidents during those 3 days can reflect that. This may lead to increase in accidents close to railway stations while trying to cross rail line to catch trains.

Also normally on Saturday the number of trains in service reduce as there are no office trains. But on Sunday evening trains are dispatched to relevant areas from Colombo to start the Office Train Service on Monday. This dispatch does not carried out in a proper pattern. Therefore people do not have proper understanding about the time of the trains. This affect the Monday and Tuesday as well.

3.2.4 Gender of the victim

Analysis for the accidents occurred during the year 2016 is shown in the following table.

Table 5 : Gender of the victim

| | Gender | |
|--------|-----------|---------|
| | Frequency | Percent |
| Male | 191 | 84.1 |
| Female | 36 | 15.9 |
| Total | 227 | 100 |

Figure 8 : Gender of the Victim

Even in places where alternative paths were available it could be seen that people are tend to use the rail line. Among them who referred the rail line even when alternative paths available the number of male were considerably higher than the number of the females as their level of confidence is high therefore neglect the risk. That fact was highlighted when I did some interviews with trespassers. Males having the higher percentage of trespassers accidents has reflected that trend.

3.2.5 Age of the victim

Following table shows the analysis of cases according to age.

Table 6 : Age of the victim

| | Number of cases | Percentage (%) |
|---------|-----------------|----------------|
| <18 | 0 | 0 |
| 18-60 | 37 | 16.3 |
| >60 | 14 | 6.2 |
| Unknown | 176 | 77.5 |

Figure 9 : Age of the victim

As the age of the victim of 77.5% cases were not available it is not appropriate to come to a conclusion with available data.

Suggestions: A standard format for recording the data relevant to the accidents is not available. This is the reason for unavailability of complete and descriptive records. Standard format should be introduced.

3.2.6 Visibility

Following table shows the analysis the visibility of the area of the cases occurred during 2016

Here visibility means the Engine drivers viewing distance without obstruction.

If the viewing distance is more than 200m is was considered as “Very Good”

If it is between 100m-200m then it was considered as “Good”

If it is less than 100m then it was considered as “Bad”

(200m - Normal breaking distance, 100m - Emergency breaking distance)

Table 7 : Visibility

| | Visibility | |
|-----------|------------|---------|
| | Frequency | Percent |
| Very Good | 28 | 12.3 |
| Good | 166 | 73.1 |
| Bad | 20 | 8.8 |
| Total | 214 | 94.3 |

Figure 10 : Visibility

There is a trend among drivers to increase the speed of the train in areas where visibility is good. Then the breaking distance increases and the time available for the pedestrian to cross the track decreases.

3.2.7 Noise level of surrounding area

The following table analyses the noise level of surrounding area of the accidents occurred during the year 2016.

Here the noise level means a qualitative measurement taken by field officers.

Table 8 : Noise Level of surrounding area

| | Noice_Level | |
|--------|-------------|---------|
| | Frequency | Percent |
| High | 123 | 54.2 |
| Medium | 68 | 30 |
| Low | 35 | 15.4 |
| Total | 226 | 99.6 |

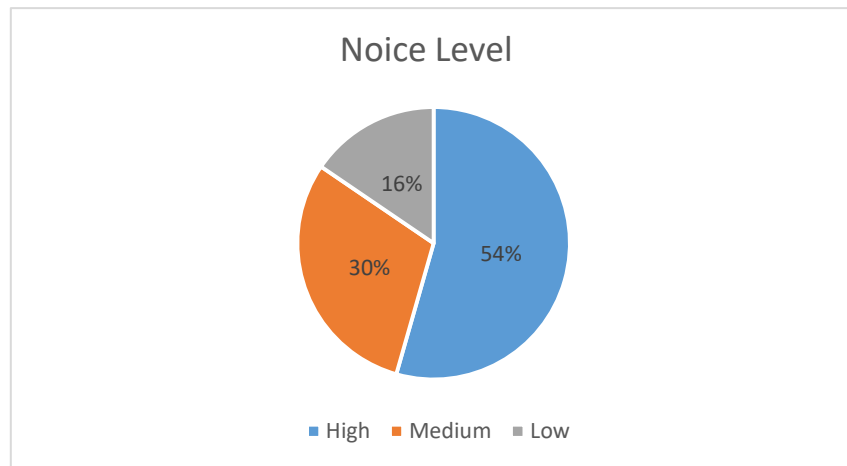

Figure 11 : Noise Level of surrounding area

As the noise level of surrounding area increases the ability to hear the noise of the train coming decreases. It is difficult to identify the horn of the train and heavy vehicles separately as both of them have similar sound.

3.2.8 Speed of the train

Following table shows the analysis of the speed of the train of the cases occurred during the year 2016.

Here high means the speed is 80 km/h or more

Medium means the speeds between 80 km/h-40 km/h

Low means the speed lower than 40 km/h

Table 9 : Speed of the train

| | Speed_of_the_train | |
|--------|--------------------|---------|
| | Frequency | Percent |
| High | 170 | 74.9 |
| Medium | 36 | 15.9 |
| Low | 20 | 8.8 |
| Total | 226 | 99.6 |

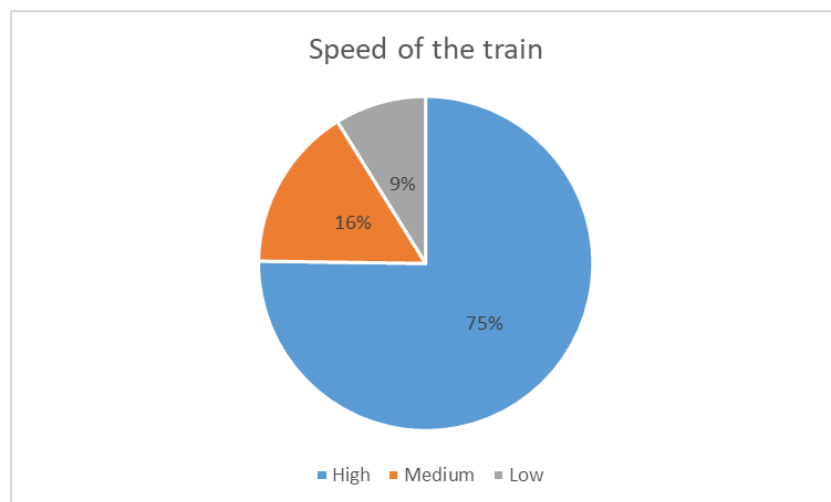

Figure 12 : Speed of the train

As the speed of the train increases, the breaking distance increases and the time available for the pedestrian to cross the track decreases.

3.2.9 Availability of parallel lines

Availability of parallel lines means available of parallel roads to use instead of rail track for pedestrians on either side or single side. It has been analysed in the following table.

Table 10 : Availability of parallel Roads

| | Availability_of_parallel_lines | |
|---------------|--------------------------------|---------|
| | Frequency | Percent |
| Available | 107 | 47.1 |
| Not available | 117 | 51.5 |
| Total | 224 | 98.7 |

Figure 13 : Availability of parallel Roads

3.2.10 Weather Conditions

The weather condition during the time of the cases occurred during the year 2016 is analysed below.

Table 11 : Weather Conditions

| | Weather_Condition | |
|-------|-------------------|---------|
| | Frequency | Percent |
| Sunny | 123 | 54.2 |
| Rainy | 68 | 30 |
| Night | 35 | 15.4 |
| Total | 226 | 99.6 |

Figure 14 : Weather Conditions

In sunny conditions due to sun rays train cannot be seen properly from distance.

3.2.11 Train Line

Train route of the train of the cases occurred during the year 2016 is shown below.

Table 12 : Train Line

| | Train Route Frequency | Percent |
|---------------|--------------------------|---------|
| Main Line | 91 | 40 |
| Puttalam Line | 20 | 9 |
| Northern Line | 5 | 2 |
| Coastal Line | 89 | 40 |
| KV Line | 20 | 9 |
| Total | 225 | 100 |

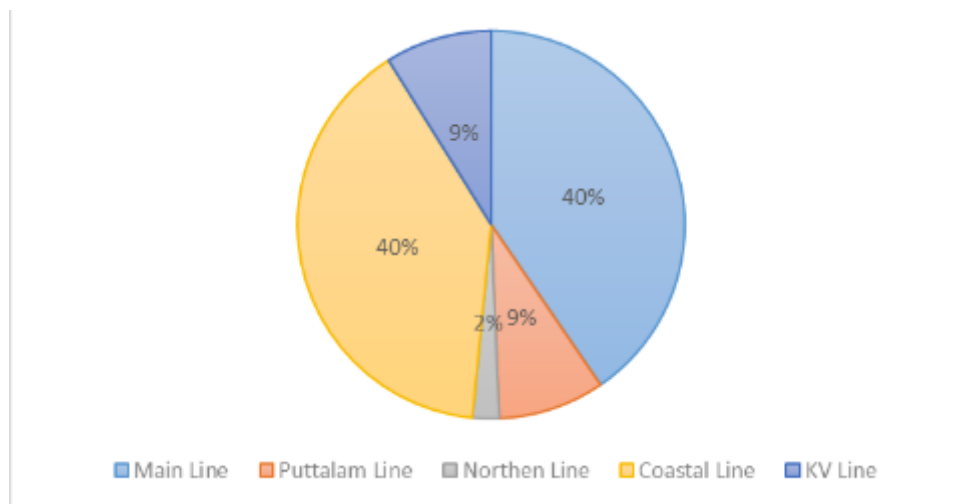

Figure 15 : Train Line

The Main line and the Coastal line can be identified as the lines with highest service level. Therefore number of trains per day is high and the number of accidents would have gone up due to that.

3.2.12 Type of train

Type of the train of the accidents during the year 2016 is analysed below.

Table 13 : Average type of train per day

| Type of train | |
|---------------|-----------|
| | Frequency |
| Unknown | 10 |
| Power Set | 156 |
| Loco | 61 |
| Total | 227 |

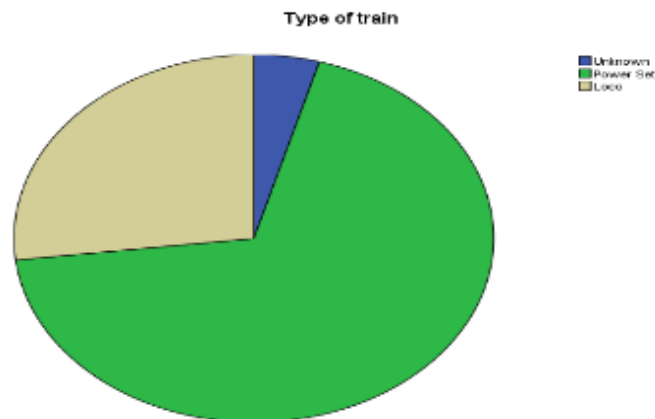

Figure 16 : Type of train

The highest number of victims have collided with power sets. Due to smooth operation of power sets the noise is low and pedestrians cannot hear the noise of the train.

The decrease in number of accidents on Saturday can be explained with this. As the number of power sets in service on Saturdays reduce due to not having office trains the number of accidents have gone down.

Daily average 237 trains are in operation within the area that has taken into consideration. Among them 40 are locos driven and 197 are power sets. Total 83% represent power set.

4 CONCLUSION & RECOMMENDATIONS

4.1 *Conclusion & Recommendations*

By considering above analysis it can be stated that more than the in-efficiencies in railway system, the ignorance of the risk by the people as even when parallel lines were available people had used the railway track (Photo 1, Photo 2, Photo 3), has caused most of the trespass accidents.

Therefore preventative methods to avoid people get to the rail line should be taken place.

During British Era prohibition of trespassing on rail line was done strictly. And also rules had been set to reduce trespassing.

But by considering areas where no alternative paths are available such as some areas between Nawalapitiya to Badulla the only available path for people to their house and their day to day work is rail track, using law could be less helpful in preventing trespassing activities. So that it is essential to look for alternative methods.

Fences can be used to prevent people get in to the rail line especially in more populated areas and the areas where a high risk of trespass accidents has been identified.

Also educating people about the risk of trespassing, using TV commercials can be used.

However as it is clear that the most appropriate method in preventing trespass accidents is trying to minimise trespassing we can even use modern social media marketing methods such as social media marketing, viral marketing, guerrilla marketing and influencer marketing in achieving our goal which is to make people avoid rail line as much as possible. For that initial cost may be high but at the end if the number of trespass accidents go down it would be valuable as it saves a lot for the country's economy.

But potential drawback can be the increasing of suicides in rail lines as people get more aware of a method for suicides.

It is worth noting that some measures have potentially opposing effects. For example, campaigns to raise awareness of rail-related risks can influence positively the adoption of safe behaviours in the population, but they could also have a negative effect by increasing the attractiveness of rail as a means of suicide. (El Miloudi El Koursi, 2016)

Most accident was occurred during the peak hours. Railway has double and triple line in the suburban areas. In the peak hours all lines are used to run trains in one direction. Trespassers were knocked down because they changed the track without looking other line rail movement. It can be minimized using illuminating lighting system fixed in the middle of the sleepers in 5m intervals which indicates the direction of the train movement and the speed.
