e-Learning Product Sales Prediction using SMS Activation Data

V. S. W. Wickramasekara
189474B

Dissertation submitted to the Faculty of Information Technology, University of Moratuwa,
Sri Lanka for the partial fulfillment of Degree of Master of Science in Information
Technology.

July 2021

Declaration

We declare that this thesis is our own work and has not been submitted in any form for another degree or diploma at any university or other institution of tertiary education. Information derived from the published or unpublished work of others has been acknowledged in the text and a list of references is given.

Acknowledgements

I am so grateful to my supervisor Mr. Saminda Premaratne, Senior Lecturer, Faculty of Information Technology, University of Moratuwa for academic guidance, advice, time, encouragement and patience that has seen me through, making this work success.

Also, I would like to give a special thanks to my beloved family members for their support, love, advice and encouragement throughout the period of my study. I lastly wish to extend my sincere gratitude toward my colleagues who have tirelessly guided and encouraged me at all times through my course.

Abstract

Most companies nowadays using data mining techniques and algorithms for the decision-making process and to make profitable adjustments in operation and production.

This helpful to identifying possibilities of a customer buying products after buying a particular product, identifying a group of customers who's in the difficulty in the activation process/ identifying customers who are going to drop from the company/ how it effects for the company, identifying connection between customer purchasing methods, find the group of customers to promote particular product/s and forecasting the product sales process (required quantity of each product for special annual events like exhibitions).

Understanding of consumers helps companies to sell more. Customers are a valuable source of information, collection of data that organizations identify different customers and observe how they behave. The more knowledge about consumers and their different needs, it is easier to identify market opportunities to sell and invent new products and target consumers with appropriate offers. Use of company past data, production and operations can predict using data mining techniques and algorithms.
