DECLARATION

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Abstract

Throughout the history of technology, various mechanisms to support the elderly and the disabled have been introduced as a remedy for the inadequacy of caregivers to provide them with the required assistance in leading an independent and secure living. Among all those mechanisms, smart homes and social robotics appear to play a significant and effective role in assuring a comfortable and safe environment for the elderly and the disabled who prefer to live independently without causing an extra burden on their families.

However, most of the existing assistive systems lack the required levels of accuracy and timeliness which causes increased probability of resulting them in higher risk of damage after encountering an emergency while staying alone at their homes. Therefore, in order to ensure the availability of timely assistance and support, the introduction and development of effective emergency detection and notification systems is an essential necessity in the present world.

This research work introduces a Smart Home System consisting of three subsystems integrated together over an IoT Cloud with the main objective of improving the quality of life of the elderly and the disabled by providing them with ample support in performing their activities of daily living without compromising safety and independence.

The proposed system presents a novel vision based method of detecting falls from standing or walking positions that is also capable of distinguishing the identified falls among three types so that the medical attention could be easily focused. A special subsystem is also introduced for the identification of sitting postures and detection of falls from wheelchairs for the people with mobility impairments. The fall detection and posture identification are carried out with a social robot called MIRob which receives visual input through a Microsoft Kinect Sensor. A novel emergency notification system is also presented where, the notification is performed by implementing a Q-Learning algorithm using a Reinforcement Learning agent via an Android application. Through experimental studies the overall proposed system has promised to guarantee acceptable levels of accuracy and timeliness in providing assistance to the elderly and the disabled.

***Keywords-* Fall Detection, Posture Identification, Emergency Notification, Wheelchair Users, Social Robotics, Smart Homes, Independent Living**

DEDICATION

*To my family,
for always loving and supporting me...*

ACKNOWLEDGMENTS

First and foremost, I would like to express my sincere gratitude to my supervisors, Prof.A.G.B.P.Jayasekara and Dr.G.I.U.S.Perera for the continuous support, motivation and guidance offered throughout my Masters study and research.

I would also like to thank my review panelists, Dr.Kutilla Gunasekara and Prof.Chandima Pathirana for their insightful suggestions that encouraged better quality and performance in my research work.

My sincere thanks also goes to the members of the thesis committee for enlightening me with invaluable comments for the improvement of my thesis.

I would also like to extend my heartfelt gratitude to my colleagues at the Robotics and Automation Laboratory, Department of Electrical Engineering, University of Moratuwa for their immense support and valuable opinions.

Last but not least, I would like to thank my family for the unconditional love and strength provided in achieving my dreams throughout the journey of life.

This research work was partially supported by the Center for Advanced Robotics.

Tharushi Kalinga
