DECLARATION

I declare that this is my own work and this thesis/dissertation does not incorporate without acknowledgement any material previously submitted for a degree or diploma in any other University or Institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date:

The above candidate has carried out research for the PhD/MPhil/Masters thesis/dissertation under my supervision. I confirm that the declaration made above by the student is true and correct.

Name of Supervisor: Dr. Thanuja Ambegoda

Signature of the Supervisor:

Date:

ACKNOWLEDGEMENT

I would like to express my deep and sincere gratitude to Dr. Thanuja Ambegoda for guiding me to initiate, finding a great research topic to conduct the research, and for continuing support and encouragement. His supervision greatly helped me in setting goals and engaging in the research.

I would like to express my greatest gratitude to the Department of Computer Science and Engineering, the University of Moratuwa for providing the support to overcome this effort. Last but not least, my heartfelt gratitude goes to my parents and friends who supported me throughout this effort.

ABSTRACT

Gender classification is regarded as one of the vital components of security systems, recommendation systems, data access authentication and surveillance. Facial features and supervised learning remain the predominant metrics to classify genders currently. But facial feature driven approach would falter in case of incomplete or unavailable details especially when analyzing masked faces or CCTV footage and supervised learning driven approach becomes tedious and time-consuming provided large volume of labelled data. Therefore, the need of analyzing full-body images is established instead of the sole focus of facial features driven analysis as well as the less dependency on supervised learning. The proposed approach establishes the implementation of convolutional neural network (CNN) based on self-supervised learning classification algorithm that needs fewer volumes of labelled data for fine-tuning. dBOT classifier, a state-of-the-art self-supervised image classification model, is used to perform transfer learning and the subsequential fine-tuning to facilitate the training on low-quality images. The proposed model on evaluation significantly outperforms SSL based methods for small, unclear full-body gender image classification techniques applied on CCTV footage extracts.

Keywords: CNN, dBOT, Gender-Classification, CCTV

TABLE OF CONTENTS
