Thesis submitted in partial fulfilment of the requirements for the
degree Master of Engineering in Energy Technology

Department of Mechanical Engineering

University of Moratuwa

Sri Lanka

May 2023

Declaration

I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to the University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other mediums. I retain the right to use this content in whole or part in future works (such as articles or books).

Signature:

Date: 24.05.2023

The above candidate has carried out research for the Master's thesis under my supervision.

Name of the supervisor: Dr MMID Manthilake

Signature of the supervisor:

Date: 26.05.2023

Abstract

Global warming and climate change, a result of abundant anthropogenic GHG emissions, is the fundamental human development obstacle in the 21st century. In Sri Lanka, buildings and services account for roughly 29.72% of total CO₂ emissions. Energy Efficient Building Codes are one of the key initiatives proposed to reduce emissions in buildings. Sri Lanka is in the process of preparing a mandatory EEBC, and a draft 'Building Code of Sri Lanka 2020' has been released. But its potential impact on energy and GHG emissions reduction has not been properly investigated. The study presents an analysis of a prototype commercial building in Colombo, comparing the energy and GHG emissions impact of EEBC requirements from different codes, namely, Code of Practice for Energy Efficient Buildings in Sri Lanka – 2008 (SLBC 2008), Draft Energy Efficiency Building Code of Sri Lanka – 2020 (SLBC 2020), ASHRAE 90.1 – 2022 and NCC Section J - 2022. The analysis was conducted using a calibrated whole-building energy model of the prototype building created using the DesignBuilder and EnergyPlus software. The results indicate that the draft SLBC 2020 can reduce overall energy use and GHG emissions by 8% compared to a BAU scenario with SLBC 2008, with the biggest improvement in lighting energy. The draft SLBC 2020 can also reduce the HVAC design load by 14.1% compared to a standard design thermal envelope. However, compared to leading EEBCs such as ASHRAE 2022 and NCC 2022, the draft SLBC 2020 lags by 2.5% and 15.6%, respectively. The energy and GHG emissions reduction potential of the draft SLBC 2020 could provide massive energy, foreign currency and GHG emissions savings to Sri Lanka over the coming years. Therefore, implementing the draft SLBC 2020 is seen as a timely solution to achieving the GHG emissions reduction targets of Sri Lanka and addressing the deep economic and energy crisis. Further, the draft SLBC 2020 has the potential for further improvements compared to some of the leading EEBCs, and the implementation of the first mandatory EEBC in Sri Lanka can be challenging.

Keywords: Building Energy Efficiency, Energy Efficient Building Codes, Energy Modelling, GHG emissions

Acknowledgement

It is with great pleasure that I express my heartfelt gratitude to everyone who helped, guided and inspired me to complete this Masters Thesis. Firstly, I would like to offer my utmost gratitude to my supervisor, Dr MMID Manthilake, for her immense guidance, enthusiastic encouragement and prompt responses to all my queries during this journey. Also, I am thankful to the whole academic staff of the Department of Mechanical Engineering, University of Moratuwa, for their advice, guidance and help throughout the journey of my Master of Engineering in Energy Technology degree.

I am also grateful to all my colleagues and friends for their stimulating and beneficial advice, which led to a supportive and friendly environment throughout my master's degree. Furthermore, I am grateful to the industry professionals who helped me during the data collection. Finally, I express a very special thanks to my parents and beloved spouse Udara Ranasinghe who have always offered me immense support and motivation to make this master's degree a reality.

TABLE OF CONTENTS

Declaration	i
Abstract	ii

Table of Contents	iv
List of Figures	vii
List of Tables	ix
List of Abbreviations	xi
List of Appendices	xiii
1 Chapter 1 - Introduction	1
1.1 Background	1
1.2 Aim	2
1.3 Objectives	2
2 Chapter 2 – Literature Review	3
2.1 Green House Gas (GHG)	3
2.1.1 What is GHG	3
2.1.2 Evolution of GHG	5
2.1.3 Environmental impact	7
2.1.4 Contribution of buildings to the GHG	10
2.1.5 Sri Lanka’s GHG scenario	12
2.2 International agreements	18
2.2.1 History of climate change policy	18
2.2.2 Climate change actions taken by Sri Lanka	23
2.3 Importance of building GHG reduction, codes and regulations	27
2.3.1 Policy and regulatory Instruments	29
2.3.2 Energy-efficient building codes	30
2.4 Building performance modelling options	35

2.5	Summary	37
3	Chapter 3 - Methodology	39
3.1	Overview of research methodology	39
3.1.1	Phase I	39
3.1.2	Phase II	41
3.2	Energy modelling	42
3.3	Prototype Building Model	42
3.4	Data collection	43
3.5.1	Building design and building code data	43
3.5.2	Building energy consumption historical data	54
3.5	Uncertainties in building energy modelling	54
3.6	Model calibration	55
4	Chapter 4 - Results	61
4.1	Prototype building model	61
4.1.1	Model geometry	61
4.1.2	Building constructions	63
4.1.3	HVAC zoning	63
4.1.4	HVAC system	64
4.2	Model calibration	66
4.2.1	Historical energy use analysis	66
4.2.2	Pre-calibration results	67
4.2.3	Post-calibration results	68
4.3	Energy estimates for EEBCs	70
4.4	GHG emissions estimate for EEBCs	72
4.5	The implication of selected building code measures	74
4.5.1	Significance of thermal envelope improvements	74
4.5.2	Impact of building airtightness	76
4.5.3	Outdoor air supply	76

5	Chapter 5 - Discussion	78
5.1	Building energy reduction potential	78
5.2	Building GHG emissions reduction potential	80
5.3	Further improvements for Sri Lankan Building Code	82
5.4	Challenges to the implementation of the Sri Lankan Building Code	84
5.5	Use of building energy modelling in designing future building codes and buildings	85
6	Conclusion	87
