DECLARATION

I hereby declare that this submission is my own work and that, to the best of my knowledge and behalf, it contains no material previously published or written by another person nor material, which to substantial extent, has been accepted for the award of any other academic qualification of a university or other institute of higher learning except where acknowledgment is made in the text.

ACKNOWLEDGEMENT

Comprehensive support, guidance and encouragement were the main driving forces which contributed to complete the task on expected time. I sincerely thank Prof R.A Attalage, Senior Lecturer Mechanical Engineering, University of Moratuwa and Dr. Thusitha Sugathapala, course coordinator MEng. Programme (2003/2004) and Head of the Department, Mechanical Engineering, University of Moratuwa for their dedication, supervision and coordination.

The gained knowledge by carrying out this kind of study will greatly help for my future development. I express my deepest gratitude to The Managing Director Mr Lucky Chikera and Factory Manager Mr. Thagitha Perera of M/s Lanka Walltile Meepe (Pvt) Limited for giving me this opportunity to follow this MEng Energy technology course and Factory Accountant Mr. Mr Ariyaratna Nelundeniya for supporting me to collect necessary details of two factories.

I wish to thank Mr Sameera Ganegoda Engineer, M/s Lanka Transformers Limited for helping me on providing necessary technical details and writing this thesis.

Finally I greatly appreciate and thank for all my family members, all members in engineering staff of M/s Lanka Walltile Meepe (Pvt) Ltd, all staff members who engaged in MEng. Energy programme 2003/2004, University of Moratuwa and all members of MEng. Energy technology batch 2003/2004 for helping me in numerous ways in different stages of this study which was utmost importance in bringing out this event success.

ABSTRACT

Energy productivity is a critical factor for the Sri Lankan manufacturing industries which is a critical issue that affects the cost of production. Efficiency in consumption of energy and its conservation would be one of the most important means of energy cost reduction and also for meeting future energy demand. The ceramic industry is one of energy intensive industry in Sri Lanka which uses massive quantity of thermal energy as well as electrical energy for the manufacturing processes. An analysis was carried out to assess the energy consumption of two industrial processes in manufacturing ceramic wall tiles using technologies of conventional and fast firing. Conventional firing technology is the oldest technology and fast firing technology is the latest technology that are being used to fire ceramic products.

The main objective of the study was to analyze the energy efficiency of technologies in a broad view and as secondary to study the energy conservation techniques used and can be used in order to reduce the energy consumption. The method of embedded energy analysis was used to analyze the energy of two processes under certain boundary conditions. Analysis of embedded energy was calculated in three levels such as level 1 direct energy supplied by the fuels and electricity, level 2 all ancillary energy inputs and level 3, energy in raw materials. The calculated embedded energy of wall tiles manufactured with the technology of conventional firing is 16 GJ/ MT and similarly the embedded energy of wall tiles manufactured with the technology of fast firing is 9 GJ / MT. The energy consumption in each levels, level 1, level 2 and level 3 of conventional firing technology is 96.7%, 2.4 %, and 0.9% respectively and in fast firing technology is 96.5%, 2.4%, 1.1% respectively.

The latest technology of fast firing technology has been developed highly considering of energy efficiency productivity and product quality. The fast firing technology consist of many kinds energy saving technologies such as waste heat recovery, high thermal efficient kiln furniture and refractory, high efficient burners, efficient tile transportation methods. Out of two technologies of fast firing and conventional firing the most energy efficient technology is the fast firing technology which is 12% more efficient than the conventional firing with compared to the result of the study. Further the implementation of energy conservation techniques to the existing plants will be incorporated to reduce energy consumption by 5 to 10 percent on electrical and 2 to 5 percent on thermal.

TABLE OF CONTENTS

	Page.
1. Research problem being analyzed	01
1.1. Background	01
1.2. Objectives and contribution	04
1.3. Research objectives	05
2. Literature review	07
2.1. What is ceramics?	07
2.1.1. Advance ceramics	09
2.2. Ceramic wall tile manufacturing process	10
2.2.1. Body slip preparation	11
2.2.2. Spray drying	12
2.2.3. Pressing and drying	13
2.2.4. Biscuit firing	15
2.2.5. Glazing and printing	19
2.2.6. Glost firing	19
2.2.7. Final selection	20
2.3. Firing Technology	20
2.3.1 Industrial Firing Processes	20
2.3.2. Types of Kilns	21
2.3.3. Air Ratio in kilns	26
2.3.4. Burning of fuels	27
2.4. Energy Analysis	29
2.4.1. Local power generation scenario	29
2.4.2. Energy in Building construction	31
2.4.3. Embedded energy of building materials	33
2.5. Embedded Energy.	36
2.6. Boundary condition	39

3. Technological Status	41
3.1. Historical data of fast firing technology	41
3.1. Historical data of conventional firing technology.....	44
4. Methodology, Calculation and approach	47
4.1. Level 1 energy analysis	47
4.2. Level 2 energy analysis	49
4.3. Level 3 energy analysis	51
5. Results and analysis.	53
5.1. Embedded energy analysis.	53
5.2. Direct energy comparison in two technologies.....	56
5.3 Energy Flow charts	57
5.4 International standards of energy consumption.	60
5.2.1. Introduction	60
5.2.2. Specific energy consumption	60
5.5. Energy efficient out put capacity.....	61
6. Discussion & Conclusion	65
6.1. Energy saving techniques.	67
6.1.1. Electrical energy.	67
6.1.2. Thermal energy.	68
6.1.3. Heat balance	70
7. Conclusion	72

Appendix C	82

LIST OF TABLES

	Page
Chapter 2	
2.1 Change of properties in ceramic body at temperatures	17
2.2 Phase changers and critical points of firing ceramic tiles	17
2.3 Firing temperature and firing time of various ceramic products	25
2.4 Thermal energy consumption of various	25
2.5 Summery of local power generation	29
2.6 Embedded energy of building materials	34
 Chapter 3	
3.1 Raw material consumption in fast firing technology	41
3.2 Direct energy consumption in fast firing technology	42
3.3 Direct employees in fast firing technology	43
3.4 Raw material consumption in conventional firing technology	44
3.5 Direct energy consumption in conventional firing technology	45
3.6 Direct employees in conventional firing technology	46
 Chapter 4	
4.1 Level one energy comparison	48
4.2 Energy consumed by the auxiliary machinery	49
4.3 Energy input by the employees	50
4.4 Raw material transportation	51
4.5 Level three energy analysis of two technologies	52
 Chapter 5	
5.1 Embedded energy consumption of wall tile manufacturing	53
5.2 Energy consumption comparison of two technologies per square meter	55
5.3 Energy consumption comparison of two technologies per MT	55
5.4 Direct energy consumption in two technologies	57
5.5 Direct energy consumption of clay product in European countries	60
5.6 Embedded energy in different output capacities of conventional firing technology...	62
5.7 Embedded energy in different output capacities of fast firing technology	63

Appendix

A.1 Level 1 energy in fast firing technology	77
B.1 Level 2 energy in conventional firing technology	81
C.1 Details of raw material transportation in fast firing technology	82
C.2 Details of raw material transportation in conventional firing technology	86
