RIGID PAVEMENT DESIGN WITH RECYCLED CONCRETE AGGREGATE FOR LOW VOLUME ROADS

This Thesis Submitted to the Department of Civil Engineering of the University of Moratuwa in Partial Fulfillment of the Requirement Towards the Degree of Master of Science

SUPERVISED BY

Dr. W.K. Mampearachchi

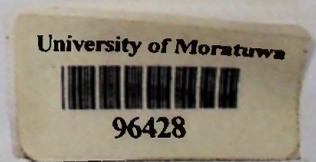

Co – Supervisor

Prof S.M.A. Nanayakkara

DEDICATION

TO MY MOTHER AND FATHER

For their continuous dedication and encouragement for my advancement

ACKNOWLEDGEMENTS

The author gratefully acknowledges the research supervisor, Dr. W.K. Mampearachchi, senior lecturer of the department of Civil Engineering for his invaluable guidance and support throughout the research period.

Sincere gratitude is extended particularly to Prof. Ramzdeen, Professor of the department of Building Economics for granting necessary funds from European Union for this study. And also the sincere thanks go to Prof. Bandara for providing the coordination and advices throughout the project.

Author wishes to express thanks to co-supervisor Prof. S.M.A. Nanayakkara who constantly gave his comment and ideas for the improvement of the project during the testing phase.

The support rendered by my fellow student Waruna Jayasooriya and others are also greatly appreciated.

The support given by Prof. W.P.S. Dias (Head, Department of Civil Engineering), and Prof. Bandara (Research Coordinator, Department of Civil Engineering) is acknowledged gratefully. All the other lectures are thanked for the positive attitude they adopted in promoting research in the department of Civil Engineering.

In addition technical officers of the Department of Civil Engineering, Mr. S.P. Madanayake, Mr. S. L. Kapuruge and laboratory assistants Mr. L. Perera and Mr. H.N Fernando and technical assistant Mr. B.S.P.A. Mendis are very much appreciated for their support given to carry out the experimental programme throughout this project.

Finally, the author wishes to thank all those who contributed undying support throughout the year to the completion of this project successfully.

ABSTRACT

The aim of this project is to determine the strength characteristic of recycled aggregates that can be used as an alternative material for rigid pavement construction.

The main consideration of any pavement design is to provide structural alternatives that are feasible both technically and economically. This can be achieved by specifying pavement layer thickness with proper types of materials based on the extent traffic, environmental conditions and life cycle cost analysis.

Since traffic is regarded as the key design parameter, traffic analysis was done for seventeen provincial roads. That analysis was carried out to find vehicle composition, magnitude of the axle loads, axle configuration and frequency of load repetitions.

An experimental campaign was implemented in order to monitor the recycled aggregate properties before utilizing them as a rigid pavement construction material. Properties of recycled aggregate were determined in terms of (i) particle size distribution (ii) particle density (iii) porosity and absorption (IV) particle shape (v) strength and toughness.

Then the development of concrete mix design was done. In this study, various physical and mechanical properties of concretes were examined. The concrete properties were determined by doing the workability test, compressive test, flexural strength and modulus of elasticity test.

Then suitable thicknesses for provincial roads were proposed based on the traffic volume and the recycled aggregate concrete properties.
